

Environment Initialization & Assignment Instructions

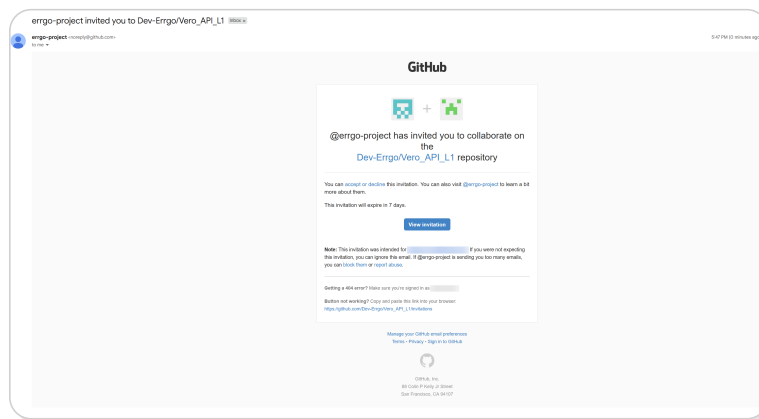

This document provides step-by-step instructions to initialize your isolated development environment using GitHub Codespaces and outlines the tasks required to complete the assignment.

Total Time to Complete: 5 hours. Any commits made after this window will not be graded.

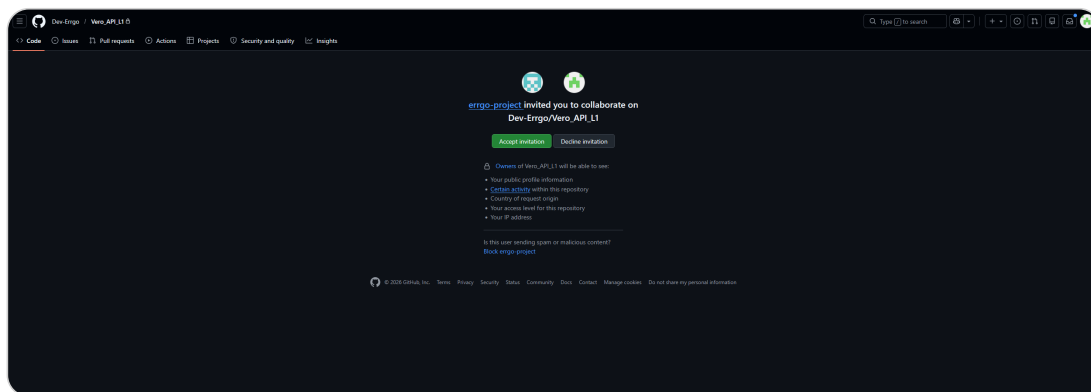

Step 1: Log In & Accept the Invitation

Log in to GitHub using the same email address where you received your assignment notification.

Accept the repository invitation sent to your email from **errgo.project@gmail.com**. This grants you view access to the master template project.

Invitation email from errgo-project — click *View invitation*.

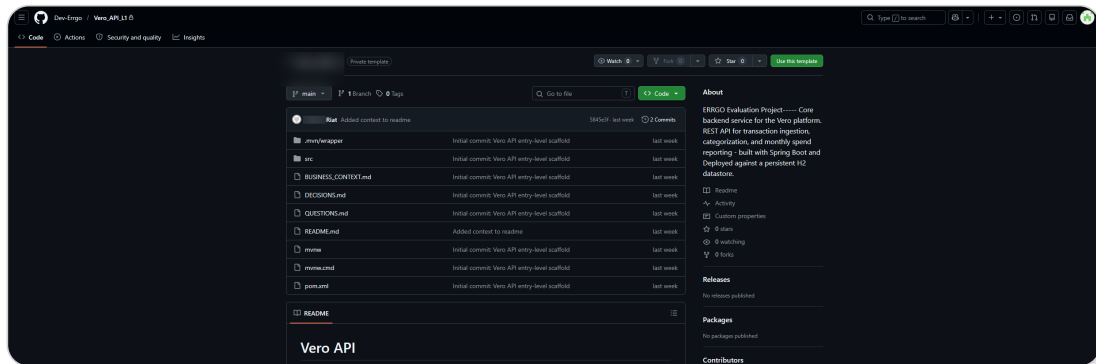

GitHub invitation page — click **Accept invitation**.

Step 2: Generate Your Private Repository From the Template

Do not look for a “Fork” button. You will be creating an independent copy from our template blueprint.

Navigate to the main page of the repository you just accepted access to. Click the green **“Use this template”** button near the top right of the page, then select **“Create a new repository”**.

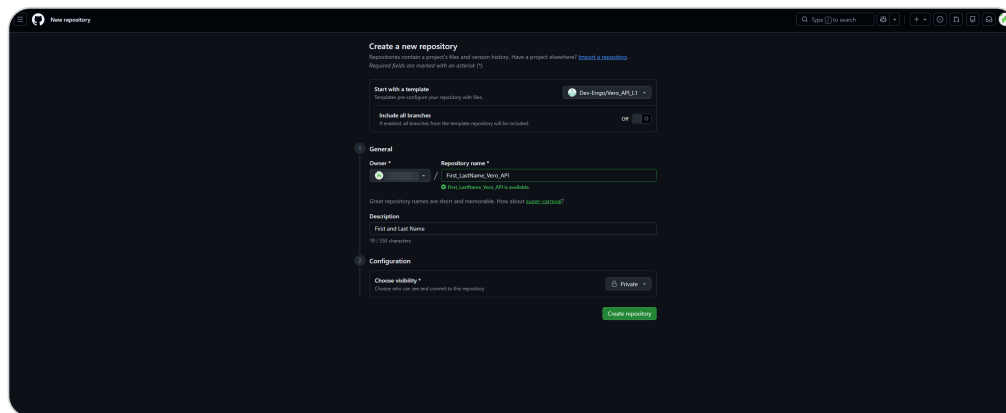

Click **Use this template** → **Create a new repository**.

On the configuration page:

- **Owner:** Select your personal GitHub profile.
- **Repository Name:** Keep the repository name as the Original Repository shared "Vero_API_L1"
- **Visibility (Crucial):** Select **Private** so your work remains invisible to other candidates.

Click **“Create repository from template”** and wait a few seconds for GitHub to copy the files into your account.

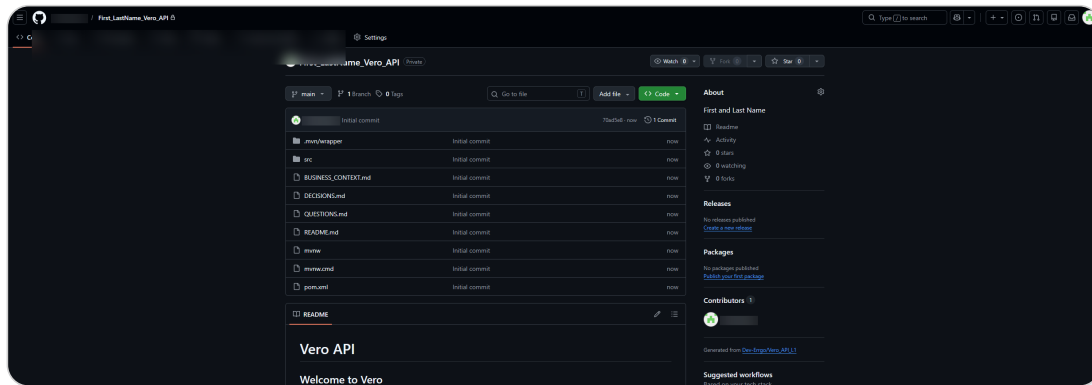

Configure the new repository — visibility must be **Private**.

Step 3: Grant Review Permissions to the Evaluation Team

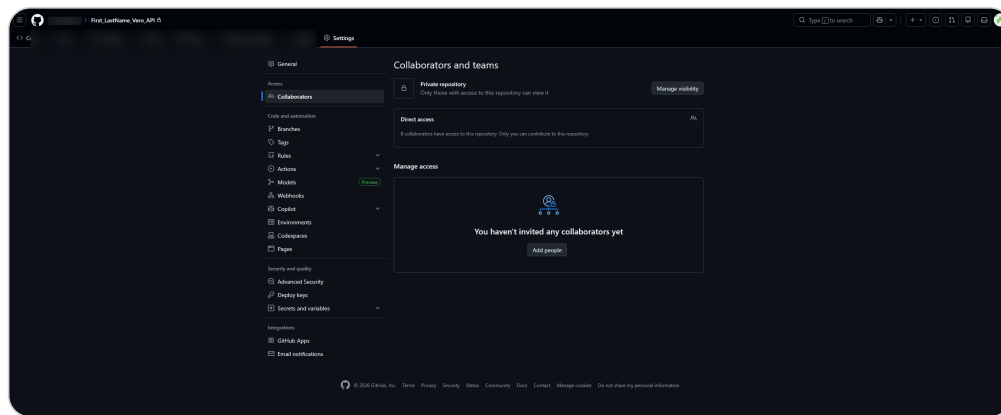

Because your new repository is strictly private, you must explicitly give our grading team access so we can review your submission.

Inside your newly created repository, click the **Settings** tab in the top navigation bar.

Open **Settings** on your new private repository.

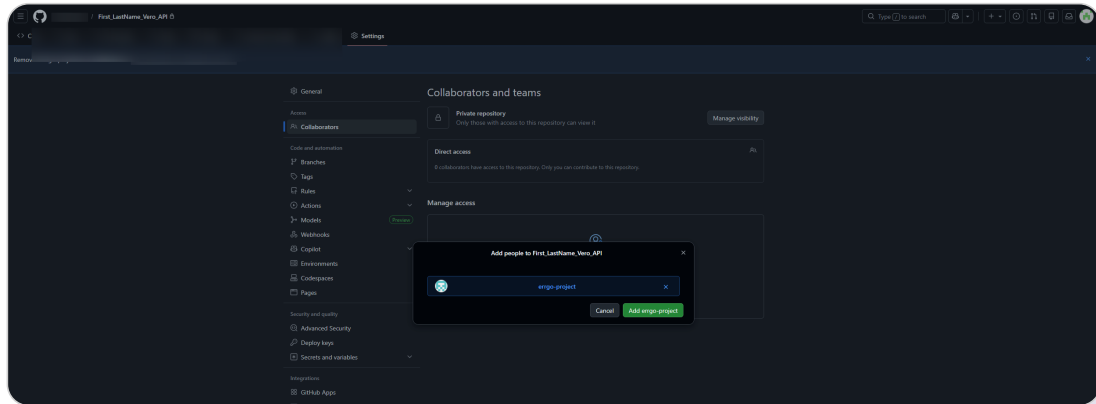

In the left-hand sidebar, select **Collaborators** (or **Collaborators and teams**), then click the **Add people** button.

Settings → Collaborators → **Add people**.

Type **errgo-project** (or paste **errgo.project@gmail.com**), select the user from the dropdown, and click **Add errgo-project** to this repository.

Environment Initialization & Assignment Instructions

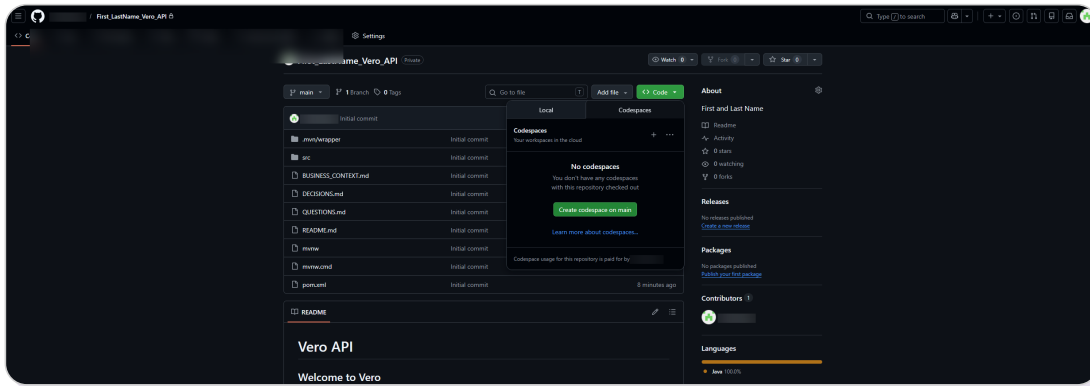

Add **errgo-project** as a collaborator.

If GitHub asks you to choose a role for the collaborator, select **Admin** (or **Write** if Admin is not offered). Some accounts skip this dialog entirely and add the collaborator with the default role — that is also fine.

Step 4: Launch Your GitHub Codespace

Return to the main **Code** page of your repository. Click the green **<> Code** button at the top right, select the **Codespaces** tab, and click **Create codespace on main**.

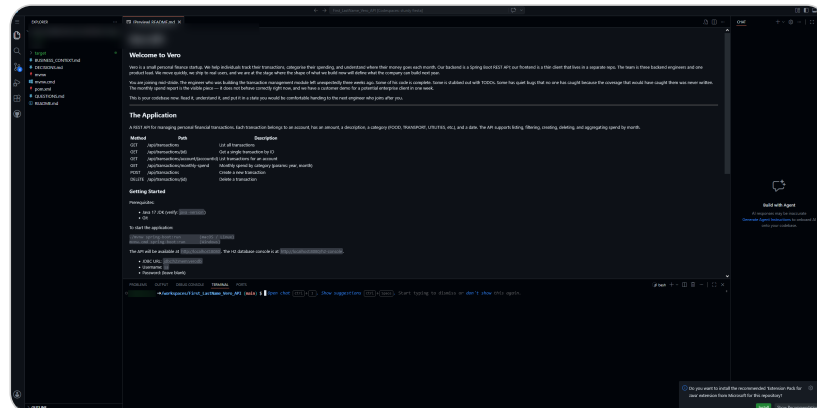

Code → Codespaces → Create codespace on main.

Wait for the Codespace to finish loading before you start coding. The environment opens in your browser immediately, but Java, Maven and the language tooling need ~60–90 seconds to initialize in the background. You are ready when the bottom status bar shows **Java: Ready** — while it is still working you will see *Java: Searching...* or *Building workspace*.

Watch the VS Code status bar at the bottom — wait for **Java: Ready**.

Codespace ready — start by reading **README.md**.

Step 5: Complete & Submit Your Assignment

Work through the coding tasks detailed in the repository's **README.md** from inside your Codespace. Use **git** to commit your changes as you progress — meaningful, incremental commits are part of how we evaluate your work.

Final Submission Step. When you are completely finished, your very last commit message must be exactly: **Assessment Completed**.

Any project whose final commit message differs from this exact text will not be recognized by our automated system as submitted. **Copy and paste** the text to avoid typos.

Happy Coding!
